

Meadow theme

The main feature in this front yard is a meadow theme.

The lawn area is replaced with a low water use meadow grass, surrounded by drought tolerant plant material with year-round color. The three trees provide shade to a portion of the landscape to reduce transpiration from the plants and evaporation from the soil.

The combination makes the landscape water efficient.

This garden, with a landscaped area of 1,700 square feet, requires about 14,280 gallons of irrigation water per year in the San Benito County area. A landscape of the same size with high water use plant material would require an additional 23,830 gallons.
